Long life lubrication for rotary kilns

Just four applications of PBC lubricant a year keep many rotary kilns rolling smoothly with no risk of seizure.

PBC* (PolyButylCuprysil) is an organo-metallic lubricant complex for service under slow moving, heavily loaded conditions in temperatures as high as 800°C (1472°F).

Supplied at the consistency of an NLGI No. 2 grease, PBC does not melt, drip or throw off and is highly resistant to water (fresh, salt or demineralized) as well as to acid solutions. PBC is very easy to apply, either by manual feeding or with a pump, at assembly or during operation of the kiln. **Frequent applications are not required...three month lube intervals are common.**

The anti-seizure capabilities of PBC make it an ideal lubricant for other stress points around the kiln and it is frequently successful in loosening stuck rings—very inexpensively! Samples for evaluation and further information from Halpen Engineering Inc., 1051 Clinton Street, Buffalo, N.Y. 14206.

Halpen Engineering Limited
